2010 AP® COMPUTER SCIENCE A FREE-RESPONSE QUESTIONS

2. An APLine is a line defined by the equation ax + by + c = 0, where a is not equal to zero, b is not equal to zero, and a, b, and c are all integers. The slope of an APLine is defined to be the double value -a/b. A point (represented by integers x and y) is on an APLine if the equation of the APLine is satisfied when those x and y values are substituted into the equation. That is, a point represented by x and y is on the line if ax + by + c is equal to 0. Examples of two APLine equations are shown in the following table.

Equation	Slope $(-a/b)$	Is point (5, -2) on the line?
5x + 4y - 17 = 0	-5 / 4 = -1.25	Yes, because $5(5) + 4(-2) + (-17) = 0$
-25x + 40y + 30 = 0	25 / 40 = 0.625	No, because $-25(5) + 40(-2) + 30 \neq 0$

Assume that the following code segment appears in a class other than APLine. The code segment shows an example of using the APLine class to represent the two equations shown in the table.

```
APLine line1 = new APLine(5, 4, -17);
double slope1 = line1.getSlope();  // slope1 is assigned -1.25
boolean onLine1 = line1.isOnLine(5, -2); // true because 5(5) + 4(-2) + (-17) = 0
APLine line2 = new APLine(-25, 40, 30);
double slope2 = line2.getSlope();  // slope2 is assigned 0.625
boolean onLine2 = line2.isOnLine(5, -2); // false because -25(5) + 40(-2) + 30 \neq 0
```

Write the APLine class. Your implementation must include a constructor that has three integer parameters that represent a, b, and c, in that order. You may assume that the values of the parameters representing a and b are not zero. It must also include a method <code>getSlope</code> that calculates and returns the slope of the line, and a method <code>isOnLine</code> that returns <code>true</code> if the point represented by its two parameters (x and y, in that order) is on the APLine and returns <code>false</code> otherwise. Your class must produce the indicated results when invoked by the code segment given above. You may ignore any issues related to integer overflow.
